### A Z Library Advanced Quantum

Based on two-photon hyperentanglement - that is, two photons simultaneously entangled in polarization, color (wavelength), and spatial modes - Lixiang Chen and co-workers develop a new parallel ghost imaging system of different independent imaging channels (see article number 2000073). These channels are encoded and sustained by polarization and wavelength multiplexing while in each channel ...

To make your quantum program more efficient, the compiler will try to combine gates. The barrier is an instruction to the compiler to prevent these combinations being made. Additionally, it is useful for visualizations. For more information about the Barrier instruction, see Barrier in the Qiskit Circuit Library.

The library is not restricted to specific quantum information tasks, but it is intended to be multi-purpose and capable of simulating arbitrary quantum processes. We have chosen the C++ programming language (standard C++11) in implementing the library as it is by now a mature standard, fully (or almost fully) implemented by the most common compilers, and highly portable.
