The initiation of fatigue cracks is an event whose very definition is strongly linked to the size scale of observation. For example, materials scientists are likely to consider the nucleation of flaws along persistent slip bands as the initiation stage of fatigue failure, whilst a mechanical engineer may associate the resolution of crack detection with the threshold for crack nucleation.

In materials science, fatigue is the weakening of a material caused by cyclic loading that results in progressive and localized structural damage and the growth of cracks. Once a fatigue crack has initiated, each loading cycle will grow the crack a small amount, typically producing striations on some parts of the fracture surface.
